What is Stack Data Structure?

Stack is an abstract data type with a bounded(predefined) capacity. It is a simple data structure that allows adding and removing elements in a particular order. Every time an element is added, it goes on the top of the stack and the only element that can be removed is the element that is at the top of the stack, just like a pile of objects.

Basic features of Stack

- 1. Stack is an ordered list of similar data type.
- 2. Stack is a LIFO(Last in First out) structure or we can say FILO(First in Last out).

3. push() function is used to insert new elements into the Stack and pop() function is used to remove an element from the stack.

Both insertion and removal are allowed at only one end of Stack called **Top**.

4. Stack is said to be in **Overflow** state when it is completely full and is said to be in **Underflow** state if it is completely empty.

Applications of Stack

The simplest application of a stack is to reverse a word. You push a given word to stack - letter by letter - and then pop letters from the stack.

There are other uses also like:

1. Parsing

(https://phaysaglecom/etero/appa/detailsflid=postakudytopighteapp)

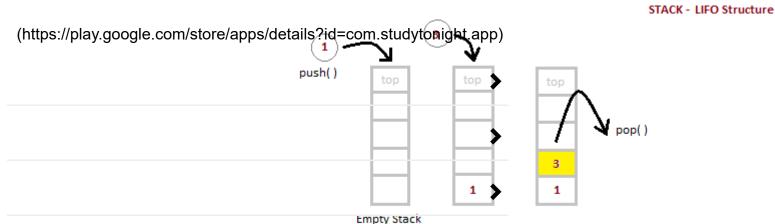

Implementation of Stack Data Structure

Stack can be easily implemented using an Array or a Linked List. Arrays are quick, but are limited in size and Linked List requires overhead to allocate, link, unlink, and deallocate, but is not limited in size. Here we will implement Stack using array.

rees)

st)

In a Stack, all operations take place at the "top" of the stack. The "push" operation adds an item to the top of the Stack.

The "pop" operation removes the item on top of the stack.

Algorithm for PUSH operation

- 1. Check if the stack is **full** or not.
- 2. If the stack is full, then print error of overflow and exit the program.
- 3. If the stack is not full, then increment the top and add the element.

Algorithm for POP operation

- 1. Check if the stack is empty or not.
- 2. If the stack is empty, then print error of underflow and exit the program.
- 3. If the stack is not empty, then print the element at the top and decrement the top.

rees

Below we have a simple C++ program implementing stack data structure while following the object oriented programming concepts.

>

st)

```
/* Below program is written in C++ language */
 (https://play.google.com/store/apps/details?id=com.studytonight.app)
     # include<iostream>
     using namespace std;
     class Stack
         int top;
         public:
         int a[10]; //Maximum size of Stack
         Stack()
             top = -1;
         // declaring all the function
         void push(int x);
         int pop();
         void isEmpty();
st)
     };
     // function to insert data into stack
     void Stack::push(int x)
         if(top >= 10)
             cout << "Stack Overflow \n";</pre>
         }
         else
             a[++top] = x;
             cout << "Element Inserted \n";</pre>
rees)
```

```
(https://play.google_com/stgre/apps/details?id=com_studytonight.app)
     int Stack::pop()
     {
         if(top < 0)
             cout << "Stack Underflow \n";</pre>
             return 0;
         else
             int d = a[top--];
             return d;
     }
     // function to check if stack is empty
     void Stack::isEmpty()
         if(top < 0)
st)
             cout << "Stack is empty \n";</pre>
         else
             cout << "Stack is not empty \n";</pre>
     }
     // main function
     int main() {
         Stack s1;
         s1.push(10);
```

```
s1.push(100);
/*
(https://play_google.com/store/apps/details?id=com/studytonight.app)
*/
}
```

Position of Top	Status of Stack
-1	Stack is Empty
0	Only one element in Stack
N-1	Stack is Full
N	Overflow state of Stack

st) Analysis of Stack Operations

Below mentioned are the time complexities for various operations that can be performed on the Stack data structure.

• Push Operation : O(1)

• Pop Operation : O(1)

• Top Operation : O(1)

• Search Operation : O(n)

The time complexities for push() and pop() functions are 0(1) because we always have to insert or remove the data from the **top** of the stack, which is a one step process.
